Summary

Product Reliability Engineer with 5 years building full-stack .NET products and embedding reliability into customer-facing SaaS at scale. I work where product engineering meets operational excellence: system design, incident response, observability, and AI-driven operations tooling, while shipping production code. Project lead for Watchtower, an internal SRE platform whose AI triage cut manual ticket research by 80%. Focused on translating reliability risk into business impact and building the tooling, processes, and culture that let teams move fast without breaking things.

Experience

Product Reliability Engineer | Invoice Cloud | December 2021 – Present

- Lead most SRE project efforts and mentor the SRE team on best practices and reliability-first problem solving.
- Own high-severity incident response for core product domains; improved MTTR by 40% through better alerting, automation, and standardized runbooks.
- Built and standardized observability across 50+ services using metrics, logging, and distributed tracing in New Relic, giving teams actionable insight into product health.
- Reduced alert fatigue by cutting non-actionable pages **50%+**, aligning alerts to customer-impacting symptoms.

Key Project: Watchtower — SRE Operations & Reliability Platform | Project Lead · Core Developer (1 of 3)

- Lead and operate an SRE-owned internal platform that centralizes operational tooling, monitoring, and incident triage for 100+ users across Engineering and Customer Service organizations.
- Built a two-layer triage system for 100+ tickets/month that **cut manual ticket research by 80%**: a support chat that deflects 20%+ of tickets at entry, and SRE-AI, a marketplace of agentic resources that investigates the rest with a full audit trail, leaving fewer than 30% for a human and closing most tickets in 1–2 days.
- Built proactive monitoring for 200+ batch jobs and 10 servers/agents, with LLM log analysis of severity, impact, and recurrence in each page; cut time-to-detect 50%+ and reduced repeat incidents.
- Launched agentic auto-remediation that detects code-bug failures and opens fix PRs with no human in the loop.
- Helped deliver a company-wide AI PR review layer that reviews every engineering pull request (500+/month) and learns from post-incident data to catch recurring failure patterns and security risks before production.
- Exposed the engineering knowledge base to other services and agents through an MCP server, and gave teams a shared framework for building self-service ops tools instead of running manual ops work.

Technical Skills

- **Languages:** C#, SQL, Python, JavaScript, HTML/CSS, Visual Basic
- **Frameworks:** ASP.NET Core (MVC, Web API), Entity Framework, Hangfire
- **AI & Automation:** Azure AI Foundry, MCP, agentic workflows, LLM log analysis, AI code review
- **Cloud & Infrastructure:** Microsoft Azure, Terraform, Jenkins, Woodpecker, SonarQube
- **Observability & Incident Response:** New Relic, Application Insights, Jira Service Management

Education

University of Texas at San Antonio | San Antonio, TX | August 2020 – December 2022

Bachelor of Science, Computer Science (Software Engineering Concentration)
